

## Corrigendum

## Corrigendum to “Neoproterozoic chromite-bearing high-Mg diorites in the western part of the Jiangnan orogen, southern China: Geochemistry, petrogenesis and tectonic implications” [Lithos 200–201 (2014) 35–48]

- 1) The TiO<sub>2</sub> contents of “low-TiO<sub>2</sub> chromites” and “high-TiO<sub>2</sub> chromites” were reverse placed in the first paragraph of Section 4.4. The correct sentence should be “Relative to the high-TiO<sub>2</sub> (TiO<sub>2</sub> > 1.0 wt.%) chromites, the low-TiO<sub>2</sub> (TiO<sub>2</sub> < 0.5 wt.%) chromites have low Al<sub>2</sub>O<sub>3</sub> (4.0–7.6 wt.% vs. 7.7–22 wt.%) and high Cr<sub>2</sub>O<sub>3</sub> (55.7–62.4 wt.% vs. 36.0–52.1 wt.%)”.
- 2) In Fig. 9b some of the symbols were incorrect. The correct figure is shown below:

**Fig. 9.** (a) Al-Ti (Kamenetsky et al., 2001) and (b) Cr#-Ti (after Arai, 1992) plots for chromites in northern Guangxi. LIP, large igneous province; OIB, ocean island basalt; ARC, arc volcanic rocks; MORB, mid-ocean ridge basalt; SSZ, supracrustal subduction zone.
